

ABSTRACT OF THE DISCLOSURE

An organic electroluminescence display of a simple matrix type in which plural rows of scanning lines and plural columns of signal lines are arranged, and pixels are arranged at the portions where said scanning lines intersect said signal lines, said pixels having an organic electroluminescence layer inclusive of an organic light-emitting layer held between the first pixel electrodes constituted by said scanning lines and the second pixel electrodes connected to said signal lines, wherein said plural second pixel electrodes are arranged being overlapped on said scanning lines in a direction in which said signal lines are extending.

The second pixel electrodes can be arranged over plural neighboring signal lines. This makes it possible to improve the resolution in the organic electroluminescence display and to increase the size of the screen without changing either the maximum light-emitting brightness of the organic light-emitting layer or the maximum brightness required for displaying the picture.
